NEW QUESTION: 3

The Galapagos Islands are in the Pacific Ocean, off the western coast of South America.

They are a rocky, lonely spot, but they are also one of the most unusual places in the world. One reason is that they are the home of some of the last giant tortoises left on earth. Weighing hundreds of pounds, these tortoises, or land turtles, wander slowly around the rocks and sand of the islands. Strangely, each of these islands has its own particular kinds of tortoises. There are seven different kinds of tortoises on the eight islands, each kind being slightly different from the

other. Hundreds of years ago, thousands of tortoises wandered around these islands. However, all that changed when people started landing there.

When people first arrived in 1535, their ships had no refrigerators. This meant that fresh food was always a problem for the sailors on board.

The giant tortoises provided a solution to this problem. Ships would anchor off the islands, and crews would row ashore and seize as many tortoises as they could. Once the animals were aboard the ship, the sailors would roll the tortoises onto their backs. The tortoises were completely helpless once on their backs, so they could only lie there until used for soups and stews. Almost 100,000 tortoises were carried off in this way. The tortoises faced other problems, too. Soon after the first ships, settlers arrived bringing pigs, goats, donkeys, dogs and cats. All of these animals ruined life for the tortoises.

Donkey and goats ate all the plants that the tortoises usually fed on, while the pigs. Dogs and cats consumed thousands of baby tortoises each year. Within a few years, it was hard to find any tortoise eggs-or even any baby tortoises. By the early 1900s, people began to worry that the last of the tortoises would soon die out. No one, however, seemed to care enough to do anything about the problem. More and more tortoises disappeared, even though sailors no longer needed them for food. For another fifty years, this situation continued. Finally, in the 1950s, scientist decided that something must be done. The first part of their plan was to get rid of as many cats, dogs and other animals as they could.

Next, they tried to make sure that more baby tortoises would be born. To do this, they started looking for wild tortoise eggs. They gathered the eggs and put them in safe containers. When the eggs hatched, the scientists raised the tortoises in special pens. Both the eggs and tortoises were numbered so that the scientists knew exactly which kinds of tortoises they had-and which island they came from. Once the tortoises were old enough and big enough to take care of themselves, the scientists took them back to their islands and set them loose. This slow, hard work continues today, and, thanks to it, the number of tortoises is now increasing every year.

Perhaps these wonderful animals will not disappear after all. What happened first?

- A. Tortoises were put onto their backs.
- B. Sailors took tortoises aboard ships.
- C. The tortoise meat was used for soups and stews.
- D. Settlers brought other animals to the islands.
- E. Pigs had been all the sailors had to eat.

Answer: B

NEW QUESTION: 4

Sie haben ein virtuelles Azure-Netzwerk mit dem Namen VNet1, das ein Subnetz mit dem Namen Subnetz1 enthält. Subnetz1 enthält drei virtuelle Azure-Maschinen. Jede virtuelle Maschine hat eine öffentliche IP-Adresse.

Die virtuellen Maschinen hosten mehrere Anwendungen, auf die Benutzer im Internet über Port 443 zugreifen können.

Ihr lokales Netzwerk verfügt über eine Standort-zu-Standort-VPN-Verbindung zu VNet1.

Sie stellen fest, dass auf die virtuellen Maschinen mithilfe des RDP (Remote Desktop Protocol) aus dem Internet und dem lokalen Netzwerk zugegriffen werden kann.

Sie müssen den RDP-Zugriff auf die virtuellen Maschinen über das Internet verhindern, es sei denn, die RDP-Verbindung wird über das lokale Netzwerk hergestellt. Die Lösung muss sicherstellen, dass die Internetbenutzer weiterhin auf alle Anwendungen zugreifen können.

Was sollte man tun?

A. Ändern Sie den Adressraum von Subnetz1.

B. Erstellen Sie eine Verweigerungsregel in einer Netzwerksicherheitsgruppe (NSG), die mit Subnetz1 verknüpft ist.

C. Entfernen Sie die öffentlichen IP-Adressen von den virtuellen Maschinen.

D. Ändern Sie den Adressraum des lokalen Netzwerk-Gateways.

Answer: B

Explanation:

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

You can use a site-to-site VPN to connect your on-premises network to an Azure virtual network. Users on your on-premises network connect by using the RDP or SSH protocol over the site-to-site VPN connection. You don't have to allow direct RDP or SSH access over the internet. And this can be achieved by configuring a deny rule in a network security group (NSG) that is linked to Subnet1 for RDP / SSH protocol coming from internet.

Modify the address space of Subnet1 : Incorrect choice

Modifying the address space of Subnet1 will have no impact on RDP traffic flow to the virtual network.

Modify the address space of the local network gateway :

Incorrect choice Modifying the address space of the local network gateway will have no impact on RDP traffic flow to the virtual network.

Remove the public IP addresses from the virtual machines :

Incorrect choice If you remove the public IP addresses from the virtual machines, none of the applications be accessible publicly by the Internet users.
