**NEW QUESTION: 2**

Which of the following is a managed service that can be used to send and receive messages between distributed applications and microservices?

A. Amazon Simple Queue Service (SQS)

B. Amazon Simple Notification Service (SNS)

C. Amazon Simple Email Service (SES)

D. Amazon Simple Storage Service (S3)

**Answer: A**

**NEW QUESTION: 3**

How is network layer addressing accomplished in the OSI protocol suite?

- A. Packet Layer Protocol address
- B. Network Service Access Point address
- C. Internet Protocol address
- D. Media Access Control address
- E. Authority and Format Identifier address

**Answer: B**

Explanation:

Explanation/Reference:

Explanation:

OSI network-layer addressing is implemented by using two types of hierarchical addresses: network service access-point addresses and network-entity titles.

A network service-access point (NSAP) is a conceptual point on the boundary between the network and the transport layers.

The NSAP is the location at which OSI network services are provided to the transport layer.

Each transport-layer entity is assigned a single NSAP, which is individually addressed in an OSI internetwork using NSAP addresses.

Network Service Address Point (NSAP) address is the equivalent of an IP address for an OSI network; A NSAP address is a

hexadecimal address with a length of up to 40 hexadecimal digits.

NSAP addresses are used in ATM and IS-IS.
