NEW QUESTION: 1

Which flag in a configuration BPDU instructs all switches to

shorten their bridge table aging process from the default 300 seconds to the current forward delay value?

- A. topology change acknowledgment bit
- B. topology change bit
- C. priority bit
- D. max-age bit

Answer: B

Explanation:

The Root Bridge continues to set the Topology Change flag (TCN bit) in all Configuration BPDUs that it sends out for a total of Forward Delay + Max Age seconds (default = 35 (20+15) seconds). This flag instructs all bridges to shorten their MAC address table (Bridge table) aging process from the default value of 300 seconds to the current Forward Delay value of the bridge (default=15 seconds).

The TCA flag is set by the upstream bridge to tell the downstream bridges to stop sending TCN BPDUs. The TC flag is set in configuration BPDU by the Root Bridge to shorten the bridge table age-out period from default 300 seconds to Forward Delay seconds.
