- B. show mst configuration name
- C. show mst configuration name
- D. show mst configuration name

Answer: A

NEW QUESTION: 4

Your users are experiencing delay issues while using their main application that requires connections to remote hosts. You run the command uptime and get the following output:

```
1:07am up 346 day(s), 12:03, 4 users, load average: 0.02, 0.02, 0.01
```

Which command will be useful in your next step of troubleshooting?

- A. traceroute
- B. ipadm
- C. arp
- D. snoop
- E. dladm

Answer: A

Explanation:

Test the remote connection with traceroute.

The Internet is a large and complex aggregation of network hardware, connected together by gateways. Tracking the route one's packets follow (or finding the miscreant gateway that's discarding your packets) can be difficult. traceroute utilizes the IP protocol 'time to live' field and attempts to elicit an ICMP TIME_EXCEEDED response from each gateway along the path to some host.

This program attempts to trace the route an IP packet would follow to some internet host by launching UDP probe packets

with a small ttl (time to live) then listening for an ICMP "time exceeded" reply from a gateway.
