NEW QUESTION: 1
You create an experiment in Azure Machine Learning Studio. You add a training dataset that contains 10,000 rows. The first 9,000 rows represent class 0 (90 percent).
The remaining 1,000 rows represent class 1 (10 percent).
The training set is imbalances between two classes. You must increase the number of training examples for class 1 to 4,000 by using 5 data rows. You add the Synthetic Minority Oversampling Technique (SMOTE) module to the experiment.

You need to configure the module.
Which values should you use? To answer, select the appropriate
options in the dialog box in the answer area.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation

Box 1: 300
You type 300 (%), the module triples the percentage of minority
cases (3000) compared to the original dataset (1000).
Box 2: 5
We should use 5 data rows.
Use the Number of nearest neighbors option to determine the
size of the feature space that the SMOTE algorithm uses when in
building new cases. A nearest neighbor is a row of data (a
case) that is very similar to some target case. The distance
between any two cases is measured by combining the weighted
vectors of all features.
By increasing the number of nearest neighbors, you get features
from more cases.
By keeping the number of nearest neighbors low, you use
features that are more like those in the original sample.
