Answer: A

NEW QUESTION: 2

- A. Option D
- B. Option C
- C. Option B
- D. Option A

Answer: C

Explanation:

In computing, traceroute is a computer network diagnostic tool for displaying the route (path) and measuring transit delays of packets across an Internet Protocol (IP) network. The history of the route is recorded as the round-trip times of the packets received from each successive host (remote node) in the route (path); the sum of the mean times in each hop indicates the total time spent to establish the connection. Traceroute proceeds unless all (three) sent packets are lost more than twice, then the connection is lost and the route cannot be evaluated. Ping, on the other hand, only computes the final round-trip times from the destination point.

NEW QUESTION: 3

Scenario: An engineer has configured an SSL virtual server and has bound a service group of type HTTP containing several servers. The service group is UP but the virtual server is in a DOWN state. The engineer has verified that the SSL feature is enabled.

What should the engineer do to ensure that the virtual server shows as UP?

- A. Bind an SSL certificate to the virtual server.
- B. Add a monitor that checks for HTTP.
- C. Change the service group to type SSL.
- D. Configure the service group to use port 443.
- E. Change the monitor for a larger time out period.

Answer: A
