**NEW QUESTION: 3**

Which three statements about EIGRP and BFD are true? (Choose three.)

258

- A. BFD is tied to specific routing protocols and can be used for generic fault detection for the OSPF, EIGRP, and BGP routing protocols.
- B. BFD is independent of the routing protocol, so it can be used as a generic failure detection mechanism for EIGRP.
- C. BFD is dependent on the EIGRP routing protocol, so it can be used as a specific failure detection mechanism.
- D. Some parts of BFD can be distributed to the data plane, so it can be less CPU-intensive than reduced timers, which exist wholly at the control plane.
- E. BFD resides on the control plane, so it is less CPU-intensive than if it resided on the data plane.
- F. Reduced EIGRP timers have an absolute minimum detection timer of 1-2 seconds; BFD can provide sub-second failure detection.

**Answer: B,D,F**

Explanation:

Explanation/Reference:

Explanation:

There are several advantages to implementing BFD over reduced timer mechanisms for routing protocols:

Although reducing the EIGRP, IS-IS, and OSPF timers can result in minimum detection timer of one to two seconds, BFD can provide failure detection in less than one second.

Because BFD is not tied to any particular routing protocol, it can be used as a generic and consistent failure detection mechanism for EIGRP, IS-IS, and OSPF.

Because some parts of BFD can be distributed to the data plane, it can be less CPU-intensive than the reduced EIGRP, IS-IS, and
