Section: Network Security

Implicit deny is the default security stance that says if you aren't specifically granted access or privileges for a resource, you're denied access by default. Rule #1 allows the Accounting workstation to ONLY access the web server on the public network over the default HTTPS port, which is TCP port 443. Rule #2 allows the HR workstation to ONLY communicate with the Financial server over the default SCP port, which is TCP

Port

22Rule #3 & Rule #4 allow the Admin workstation to ONLY access the Financial and Purchasing servers located on the secure network over the default TFTP port, which is Port 69.

NEW QUESTION: 3

Medium Scale Integration (MSI) is a technology that made it possible to integrate up to hundred components on a single chip. Which of the following computer technology generations is responsible for the MSI technology?

- A. First generation
- B. Second generation
- C. Mechanical devices generation
- D. Third generation

Answer: D

Explanation:

The third generation of computers started in 1964 and ended in 1975. The explosion in the use of computers began with the third generation computers, making use of independent invention of the integrated circuit (or microchip), which later led to the invention of the microprocessor. The Integrated Circuit (IC) made it possible to integrate larger number of circuit components into very small surface of silicon, known as chip. Initially Small Scale Integration (SSI) technology made it possible to integrate only about ten to twenty components. Later Medium Scale Integration (MSI) technology made possible to integrate up to hundred components on a single chip. Some examples of third generation computers are IBM 360/370, PDP-8, PDP-11, CDC-6600. Answer option C is incorrect. The first generation of computers started around 1940 and ended around 1956. The first generation computers used vacuum tubes for circuitry and magnetic drums for memory. This generation is also known as first electronic generation. The computers developed in this generation used vacuum tubes as a source of electronics. These computers were developed by using thousands of vacuum tubes. These computers were very large in size and were kept in a room and also required air-conditioning and constant maintenance. Some examples of first generation computers are ENIAC, EDVAC, EDSAC, UNIVAC-I, IBM-701, etc. Answer option B is incorrect. The bipolar transistor was invented in 1947. From 1955 onwards transistors replaced vacuum tubes in computer designs, giving rise to the 'second generation' of computers. Initially the only devices available were germanium point-contact transistors, which although less reliable than the vacuum tubes were replaced and had the advantage of consuming far less power. Compared to vacuum tubes, transistors have many advantages: they are smaller, and

require less power than vacuum tubes, so give off less heat. Silicon junction transistors were much more reliable than vacuum tubes and had longer, indefinite, service life. Transistorized computers could contain tens of thousands of binary logic circuits in a relatively compact space. Transistors greatly reduced computers' size, initial cost, and operating cost. Some examples of second generation computers are Honeywell 400, IBM 7030, CDC-1604, UNIVAC LARC, etc. Answer option A is incorrect. Mechanical devices generation spans a period of about three hundred years. It includes the mechanical devices that were able to perform high-level numerical calculations. It also includes the human-operated difference engines developed in this period. This generation started in the early 1600s and ended about the mid 1900s.
