NEW QUESTION: 2

For each question, select the best answer from the choices given.

Without a doubt, one of America's greatest science-fiction writers is Kurt Vonnegut, who has written dozens of stories and novels, including the masterpiece Slaughterhouse Five. Yet for decades, Vonnegut denied that what he was writing was science fiction. Today, however, Vonnegut embraces his rightful place as a master of the genre. All of the following, if true, are helpful in accounting for the phenomenon described in this passage EXCEPT

- A. as a young author, Vonnegut's favorite writers were all science-fiction writers.
- B. early in Vonnegut's career, science fiction was largely considered by critics to be an inferior genre.
- C. science fiction has become a legitimate literary genre.
- D. science fiction has become an increasingly popular genre (for readers and writers alike) because of the increased importance of science and technology in our lives.
- E. Vonnegut did not want to be pigeonholed as a science-fiction writer.

Answer: A

Explanation:

Explanation/Reference:

Explanation:

Choice c is not helpful in accounting for Vonnegut's early reluctance to be identified as a science-fiction writer because it is not relevant. The other choices are directly related to the phenomenon and help us understand why he did not originally want to be called a science-fiction writer but now welcomes the categorization.

Answer: B

NEW QUESTION: 4

Your Oracle Cloud Infrastructure Container Engine for Kubernetes (OKE) administrator has created an OKE cluster with one node pool in a public subnet. You have been asked to provide a log file from one of the nodes for troubleshooting purpose.

Which step should you take to obtain the log file?

- A. ssh into the node using public key.
- B. Use the username open and password to login.
- C. It is impossible since OKE is a managed Kubernetes service.
- D. ssh into the nodes using private key.

Answer: D

Explanation:

Explanation

Kubernetes cluster is a group of nodes. The nodes are the machines running applications. Each node can be a physical machine or a virtual machine. The node's capacity (its number of CPUs and amount of memory) is defined when the node is created. A cluster comprises:

- one or more master nodes (for high availability, typically there will be a number of master nodes)
- one or more worker nodes (sometimes known as minions)

Connecting to Worker Nodes Using SSH

If you provided a public SSH key when creating the node pool in a cluster, the public key is installed on all worker nodes in the cluster. On UNIX and UNIX-like platforms (including Solaris and Linux), you can then connect through SSH to the worker nodes using the ssh utility (an SSH client) to perform administrative tasks.

Note the following instructions assume the UNIX machine you use to connect to the worker node:

Has the ssh utility installed.

Has access to the SSH private key file paired with the SSH public key that was specified when the cluster was created.

How to connect to worker nodes using SSH depends on whether you specified public or private subnets for the worker nodes when defining the node pools in the cluster.

Connecting to Worker Nodes in Public Subnets Using SSH

Before you can connect to a worker node in a public subnet using SSH, you must define an ingress rule in the subnet's security list to allow SSH access. The ingress rule must allow access to port 22 on worker nodes from source 0.0.0.0/0 and any source port To connect to a worker node in a public subnet through SSH from a UNIX machine using the ssh utility:

1- Find out the IP address of the worker node to which you want

to connect. You can do this in a number of ways:

Using `kubectl`. If you haven't already done so, follow the steps to set up the cluster's kubeconfig configuration file and (if necessary) set the `KUBECONFIG` environment variable to point to the file. Note that you must set up your own kubeconfig file. You cannot access a cluster using a kubeconfig file that a different user set up.

See [Setting Up Cluster Access](#). Then in a terminal window, enter `kubectl get nodes` to see the public IP addresses of worker nodes in node pools in the cluster.

Using the Console. In the Console, display the Cluster List page and then select the cluster to which the worker node belongs. On the Node Pools tab, click the name of the node pool to which the worker node belongs. On the Nodes tab, you see the public IP address of every worker node in the node pool.

Using the REST API. Use the `ListNodePools` operation to see the public IP addresses of worker nodes in a node pool.

2- In the terminal window, enter `ssh [email#160;protected]<node_ip_address>` to connect to the worker node, where `<node_ip_address>` is the IP address of the worker node that you made a note of earlier. For example, you might enter `ssh [email#160;protected]`

Note that if the SSH private key is not stored in the file or in the path that the `ssh` utility expects (for example, the `ssh` utility might expect the private key to be stored in `~/.ssh/id_rsa`), you must explicitly specify the private key filename and location in one of two ways:

Use the `-i` option to specify the filename and location of the private key. For example, `ssh -i`

`~/.ssh/my_keys/my_host_key_filename [email#160;protected]`

Add the private key filename and location to an SSH configuration file, either the client configuration file (`~/.ssh/config`) if it exists, or the system-wide client configuration file (`/etc/ssh/ssh_config`). For example, you might add the following:

```
Host 192.0.2.254 IdentityFile
```

```
~/.ssh/my_keys/my_host_key_filename
```

For more about the `ssh` utility's configuration file, enter `man ssh_config`. Note also that permissions on the private key file must allow you read/write/execute access, but prevent other users from accessing the file. For example, to set appropriate permissions, you might enter `chmod 600`

`~/.ssh/my_keys/my_host_key_filename`. If permissions are not set correctly and the private key file is accessible to other users, the `ssh` utility will simply ignore the private key file.
