- A. sp\_lock
- B. sys.dm\_os\_waiting\_tasks
- C. sp\_updatestats
- D. sys.dm\_tran\_active\_snapshot\_database\_transactions
- E. sys.dm\_os\_waiting\_tasks

**Answer: A**

Explanation:

Explanation

The sp\_lock system stored procedure is packaged with SQL Server and will give you insight into the locks that are happening on your system. This procedure returns much of its information

from the syslock info in the master database, which is a system table that contains information on all granted, converting, and waiting lock requests.

Note: sp\_lock will be removed in a future version of Microsoft SQL Server. Avoid using this feature in new development work, and plan to modify applications that currently use this feature. To obtain information about locks in the SQL Server Database Engine, use the sys.dm\_tran\_locks dynamic management view.

sys.dm\_tran\_locks returns information about currently active lock manager resources in SQL Server 2008 and later. Each row represents a currently active request to the lock manager for a lock that has been granted or is waiting to be granted.
