Answer:
Explanation:

Explanation

Box1: User management occurs on-premises. Azure AD authenticates employees by using on-premises passwords. Azure AD Domain Services for hybrid organizations Organizations with a hybrid IT infrastructure consume a mix of cloud resources and on-premises resources. Such organizations synchronize identity information from their on-premises directory to their Azure AD tenant. As hybrid organizations look to migrate more of their on-premises applications to the cloud, especially legacy directory-aware applications, Azure AD Domain Services can be useful to them. Example: Litware Corporation has deployed Azure AD Connect, to synchronize identity information from their on-premises directory to their Azure AD tenant. The identity information that is synchronized includes user accounts, their credential hashes for authentication (password hash sync) and group memberships.

User accounts, group memberships, and credentials from Litware's on-premises directory are synchronized to Azure AD

via Azure AD Connect. These user accounts, group memberships, and credentials are automatically available within the managed domain.

Box 2: User management occurs on-premises. The on-premises domain controller authenticates employee credentials.

You can federate your on-premises environment with Azure AD and use this federation for authentication and authorization. This sign-in method ensures that all user authentication occurs on-premises.

NEW QUESTION: 3

What two situations could require the use of multiple routing protocols? (Choose two)

- A. when smaller broadcast domains are desired
- B. when migrating from an older Interior Gateway Protocol (IGP) to a new IGP
- C. when using UNIX host-based routers
- D. when all equipment is manufactured by Cisco
- E. because having multiple routing protocols confuses hackers
- F. when there are multiple paths to destination networks

Answer: B,C

Explanation:

Explanation/Reference:

Explanation:

Simple routing protocols work well for simple networks, but networks grow and become more complex.

While running a single routing protocol throughout your entire IP internetwork is desirable, multiprotocol routing is common for a number of reasons, including company mergers, multiple departments managed by multiple network administrators, multivendor environments, or simply because the original routing protocol is no longer the best choice.

Often, the multiple protocols are redistributed into each other during a migration period from one protocol to the other.
