- C. Broadcast storms entering from a root port are blocked
- D. The STP root bridge cannot be changed

**Answer: D**

**NEW QUESTION: 2**

What is the grace period in a graceful restart situation?

- A. how long the supervisor waits for NSF replies
- B. how often graceful restart messages are sent after a switchover
- C. how long NSF-aware neighbors should wait after a graceful restart has started before verifying that adjacencies are still valid

**Answer: C**

Explanation:

Graceful restart (GR) refers to the capability of the control plane to delay advertising the absence of a peer (going through control-plane switchover) for a "grace period," and thus help minimize disruption during that time (assuming the standby control plane comes up).

GR is based on extensions per routing protocol, which are interoperable across vendors.

The downside of the grace period is huge when the peer completely fails and never comes up, because that slows down the overall network convergence, which brings us to the final concept: nonstop routing (NSR).

NSR is an internal (vendor-specific) mechanism to extend the awareness of routing to the standby routing plane so that in case of failover, the newly active routing plane can take charge of the already established sessions.
