If the case study has an All Information tab, note that the information displayed is identical to the information displayed on the subsequent tabs. When you are ready to answer a question, click the Question button to return to the question.

LabelMaker app

Coho Winery produces, bottles, and distributes a variety of wines globally. You are a developer implementing highly scalable and resilient applications to support online order processing by using Azure solutions.

Coho Winery has a LabelMaker application that prints labels for wine bottles. The application sends data to several printers. The application consists of five modules that run independently on virtual machines (VMs). Coho Winery plans to move the application to Azure and continue to support label creation. External partners send data to the LabelMaker application to include artwork and text for custom label designs.

Requirements

Data

You identify the following requirements for data management and manipulation:

- * Order data is stored as nonrelational JSON and must be queried using Structured Query Language (SQL).
- * Changes to the Order data must reflect immediately across all partitions. All reads to the Order data must fetch the most recent writes.

Security

You have the following security requirements:

- * Users of Coho Winery applications must be able to provide access to documents, resources, and applications to external partners.
- * External partners must use their own credentials and authenticate with their organization's identity management solution.
- * External partner logins must be audited monthly for application use by a user account administrator to maintain

company compliance.

- * Storage of e-commerce application settings must be maintained in Azure Key Vault.

- * E-commerce application sign-ins must be secured by using Azure App Service authentication and Azure Active Directory (AAD).

- * Conditional access policies must be applied at the application level to protect company content.

- * The LabelMaker application must be secured by using an AAD account that has full access to all namespaces of the Azure Kubernetes Service (AKS) cluster.

LabelMaker app

Azure Monitor Container Health must be used to monitor the performance of workloads that are deployed to Kubernetes environments and hosted on Azure Kubernetes Service (AKS).

You must use Azure Container Registry to publish images that support the AKS deployment.

Architecture

Issues

Calls to the Printer API App fail periodically due to printer communication timeouts.

Printer communication timeouts occur after 10 seconds. The label printer must only receive up to 5 attempts within one minute. The order workflow fails to run upon initial deployment to Azure.

Order.Json

Relevant portions of the app files are shown below. Line numbers are included for reference only. The JSON file contains a representation of the data for an order that includes a single item.
