**NEW QUESTION: 2**

Account descriptions are maintained in which language

- A. foreign language
- B. transaction language
- C. maintenance language

**Answer: C**

**NEW QUESTION: 3**

- A. Option C
- B. Option B
- C. Option A
- D. Option D

**Answer: B**

Explanation:

\* You must use Cross Origin Resource Sharing

It's not as complicated as it sounds...simply set your request headers appropriately...in

Python it would look like:

```
self.response.headers.add_header('Access-Control-Allow-Origin', '*');
self.response.headers.add_header('Access-Control-Allow-Methods', 'GET, POST, OPTIONS');
self.response.headers.add_header('Access-Control-Allow-Headers', 'X-Requested-With');
self.response.headers.add_header('Access-Control-Max-Age', '86400');
```

\* Cross-origin resource sharing (CORS) is a mechanism that allows Javascript on a web page to make XMLHttpRequests to another domain, not the domain the Javascript originated from.[1] Such "cross-domain" requests would otherwise be forbidden by web browsers, per the same origin security policy. CORS defines a way in which the browser and the server can interact to determine whether or not to allow the cross-origin request.[2] It is more powerful than only allowing same-origin requests, but it is more secure than simply allowing all such cross-origin requests.
