A company is migrating its on-premise application to AWS. The application generates a large volume of data that needs to be processed in a specific order. The company wants to ensure that the data is processed exactly once and in the order it was received. Which AWS service should the company use to store the data before it is processed?

- C. Amazon Kinesis Data Firehose
- D. Amazon SQS Standard Queue

Answer: B

Explanation:

Explanation

Amazon SQS Introduces FIFO Queues with Exactly-Once Processing and Lower Prices for Standard Queues You can now use Amazon Simple Queue Service (SQS) for applications that require messages to be processed in a strict sequence and exactly once using First-in, First-out (FIFO) queues. FIFO queues are designed to ensure that the order in which messages are sent and received is strictly preserved and that each message is processed exactly once.

Amazon SQS is a reliable and highly-scalable managed message queue service for storing messages in transit between application components. FIFO queues complement the existing Amazon SQS standard queues, which offer high throughput, best-effort ordering, and at-least-once delivery. FIFO queues have essentially the same features as standard queues, but provide the added benefits of supporting ordering and exactly-once processing. FIFO queues provide additional features that help prevent unintentional duplicates from being

sent by message producers or from being received by message consumers. Additionally, message groups allow multiple separate ordered message streams within the same queue.
