E. Serverlã,'ç™»éĀ²ã•-ã•¾ã•™ã€,

Answer: B,D,E

Explanation:

Explanation

Step 1 (E): Install the Azure File Sync agent on Server1

The Azure File Sync agent is a downloadable package that enables Windows Server to be synced with an Azure file share

Step 2 (D): Register Server1.

Register Windows Server with Storage Sync Service

Registering your Windows Server with a Storage Sync Service establishes a trust relationship between your server (or cluster) and the Storage Sync Service.

Step 3 (C): Create a sync group and a cloud endpoint.

A sync group defines the sync topology for a set of files.

Endpoints within a sync group are kept in sync with each other.

A sync group must contain one cloud endpoint, which represents an Azure file share and one or more server endpoints. A server endpoint represents a path on registered server.

on EC2ã, ðãf³ã, ¹ã, çãf³ã, ¹ã·«ãf†ãf-ãf-ã,ðã-ã·¾ã·™ã€,

Answer: A

Explanation:

Explanation

The below diagram shows how this can be done

- 1) First create a new ELB which will be used to point to the new production changes.
 - 2) Use the Weighted Route policy for Route53 to distribute the traffic to the 2 ELB's based on a 80-20% traffic scenario. This is the normal case, the % can be changed based on the requirement.
 - 3) Finally when all changes have been tested, Route53 can be set to 100% for the new ELB.
- Option A is incorrect because this is a failover scenario and cannot be used for Blue green deployments. In Blue Green deployments, you need to have 2 environments running side by side.
- Option B is incorrect, because you need to have a production stack with the changes which will run side by side.
- Option D is incorrect because this is not a blue green deployment scenario. You cannot control which users will go the new EC2 instances.
- For more information on blue green deployments, please refer to the below document link: from AWS
https://d0awsstatic.com/whitepapers/AWS_Blue_Green_Deployments.pdf
