#### **NEW QUESTION: 1**

Refer to the exhibit.

If the network switch is configured as shown, which two statements about network traffic are true? (Choose two.)

- A. Traffic enters the shaper on a FIFO basis.
- B. Traffic enters the shaper on a weighted fair queueing basis.
- C. Voice traffic is given priority until it reaches 1.5 Mbps.
- D. Voice traffic is given priority until it reaches 6 Mbps.
- E. Drop behavior is random for traffic in excess of 6 Mbps.

**Answer: A,C**

Explanation:

A. Serial interfaces at E1 (2.048 Mbps) and below use weighted fair queueing (WFQ) by default.  
Other interfaces use first-in first-out (FIFO) by default.  
D. Voice traffic is given priority up to 25% of the shape average value, which is 6000000, so 25% of 6 Mbps is 1.5 Mbps.

**NEW QUESTION: 2**

In which situations will the ASM metadata backup help you recover the ASM disk in a disk group? (Choose all that apply.)

- A. when the data file on an ASM disk group gets corrupted
- B. when one of the disks in a disk group is accidentally unplugged
- C. when one or more disks in an ASM disk group are lost
- D. when one or more file directory paths are accidentally deleted from an ASM disk group

**Answer: C,D**

**NEW QUESTION: 3**

Which of the following is the most reliable, secure means of removing data from magnetic storage media such as a magnetic tape, or a cassette?

- A. Parity Bit Manipulation
- B. Degaussing
- C. Zeroization
- D. Buffer overflow

**Answer: B**

Explanation:

A "Degausser (Otherwise known as a Bulk Eraser) has the main function of reducing to near zero the magnetic flux stored in the magnetized medium. Flux density is measured in Gauss or Tesla. The operation is speedier than overwriting and done in one short operation. This is achieved by subjecting the subject in bulk to a series of fields of alternating polarity and gradually decreasing strength.

The following answers are incorrect: Parity Bit Manipulation. Parity has to do with disk lerror detection, not data removal. A bit or series of bits appended to a character or block of characters to ensure that the information received is the same as the infromation that was sent.

Zeroization. Zeroization involves overwrtng data to sanitize it. It is time-consuming and not foolproof. The potential of restoration of data does exist with this method.

Buffer overflow. This is a detractor. Although many Operating Systems use a disk buffer to temporarily hold data read from disk, its primary purpose has no connection to data removal. An overflow goes outside the constraints defined for the buffer and is a method used by an attacker to attempt access to a system.
