NEW QUESTION: 1
You are building a product on top of Google Kubernetes Engine

(GKE). You have a single GKE cluster. For each of your customers, a Pod is running in that cluster, and your customers can run arbitrary code inside their Pod. You want to maximize the isolation between your customers' Pods. What should you do?
A. Create a GKE node pool with a sandbox type configured to gvisor. Add the parameter runtimeClassName: gvisor to the specification of your customers' Pods.
B. Use the Container Analysis API to detect vulnerabilities in the containers used by your customers' Pods.
C. Use the cos_containerdimage for your GKE nodes. Add a nodeSelector with the value cloud.google.com/gke-os-distribution: cos_containerdto the specification of your customers' Pods.
D. Use Binary Authorization and whitelist only the container images used by your customers' Pods.
Answer: A
Explanation:

NEW QUESTION: 2
Which two options can be used for server pool qualifications? (Choose two.)
A. memory speed
B. CPU stepping
C. RAID controller
D. firmware version
E. chassis model
Answer: A,B
Explanation:
Explanation/Reference:
Explanation: A server pool contains a set of servers. These servers typically share the same characteristics. Those characteristics can be their location in the chassis, or an attribute such as server type, amount of memory, local storage, type of CPU, or local drive configuration. You can manually assign a server to a server pool, or use server pool policies and server pool policy qualifications to automate the assignment.
