NEW QUESTION: 3
Which three statements about RSTP are true? (Choose three.)
A. RSTP significantly reduces topology reconverging time after
a link failure.
B. RSTP uses the same timer-based process as STP on
point-to-point links.
C. RSTP provides a faster transition to the forwarding state on
point-to-point links than STP does.
D. RSTP also uses the STP proposal-agreement sequence.
E. RSTP expands the STP port roles by adding the alternate and
backup roles.
F. RSTP port states are blocking, discarding, learning, or
forwarding.

Convergence
Cisco enhanced the original 802.1D specification with features
such as Uplink Fast,
Backbone Fast, and Port Fast to speed up the convergence time
of a bridged network. The
drawback is that these mechanisms are proprietary and need

additional configuration.
Alternate and Backup Port Roles
These two port roles correspond to the blocking state of
802.1D. A blocked port is defined
as not being the designated or root port. A blocked port
receives a more useful BPDU than
the one it sends out on its segment.
Remember that a port absolutely needs to receive BPDUs in order
to stay blocked. RSTP
introduces these two roles for this purpose.
Rapid Transition to Forwarding State
Rapid transition is the most important feature introduced by
802.1w. The legacy STA
passively waited for the network to converge before it turned a
port into the forwarding
state. The achievement of faster convergence was a matter of
tuning the conservative
default parameters (forward delay and max_age timers) and often
put the stability of the
network at stake. The new rapid STP is able to actively confirm
that a port can safely
transition to the forwarding state without having to rely on
any timer configuration. There is
now a real feedback mechanism that takes place between
RSTP-compliant bridges. In
order to achieve fast convergence on a port, the protocol
relies upon two new variables:
edge ports and link type.
