Explanation:
In SQL Database, the relative measure of a database's ability
to handle resource demands is expressed in Database Transaction
Units (DTUs) for single databases and elastic DTUs (eDTUs) for
databases in an elastic pool.
A pool is given a set number of eDTUs, for a set price. Within
the pool, individual databases are given the flexibility to
auto-scale within set parameters. Under heavy load, a database
can consume more eDTUs to meet demand.
Additional eDTUs can be added to an existing pool with no
database downtime.
