NEW QUESTION: 1

You use Microsoft SQL Server Management Studio to develop a Microsoft Azure SQL Database instance that will support a purchase order application.
You write the following query:

A partial view of the query results can be seen in the following table.

You must generate a summary report that displays the total number of purchase orders received by each vendor for the following regions: North, East, South, West, and Central. You need to write a query that returns the results in the format shown in the following table.

Which three Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation:

Step 1: SELECT Vendorname, [North], [East],..FROM SourceTable

Step 2: WITH SourceTable AS..

Step 3: UNPIVOT ..

UNPIVOT carries out almost the reverse operation of PIVOT, by rotating columns into rows.

NEW QUESTION: 2

Scenario:

A Citrix Architect identifies a fault in the Active Directory design for CGE's existing XenApp environments. Group Policy Objects (GPOs) from OUs across the Active Directory apply when end users log on to XenApp applications, creating undesirable end-user experiences.

The architect determines that CGE needs full control over which GPOs apply in the new environment.

Why would configuring loopback processing with merge at the root level ensure full control over which Group Policies are applied?

A. It ensures that Group Policies located in the root Citrix OU are merged with Citrix policies.

B. It ensures that only Group Policies with the correct filtering in Active Directory are applied below the root level when end users log on.

C. It ensures that only Group Policies located in the root Citrix OU are applied below the root level when end users log on.

D. It ensures that only Group Policies located in the root Citrix OU are applied below the root level when end users log on.

Answer: A
