NEW QUESTION: 3

A company wants to automate the creation of secure test databases with random credentials to be stored safely for later use. The credentials should have sufficient information about each test database to initiate a connection and perform automated credential rotations. The credentials should not be logged or stored anywhere in an unencrypted form.

Which steps should a Database Specialist take to meet these requirements using an AWS CloudFormation template?

- A. Create the secret with a chosen user name and a randomly generated password set by the `GenerateSecretString` property. Add an `SecretTargetAttachment` resource with the `SecretId` property set to the Amazon Resource Name (ARN) of the secret and the `TargetId` property set to a parameter value matching the desired database ARN. Then, create a database with the `MasterUserName` and `MasterUserPassword` properties set to the previously created values in the secret.
- B. Add a resource of type `AWS::SecretsManager::Secret` and specify the `GenerateSecretString` property. Then, define the database user name in the `SecureStringTemplate` template. Create a resource for the database and reference the secret string for the `MasterUserName` and `MasterUserPassword` properties. Then, add a resource of type `AWS::SecretsManagerSecretTargetAttachment` with the `SecretId` and `TargetId` properties set to the Amazon Resource Names (ARNs) of the secret and the database.
- C. Add a Mapping property from the database Amazon Resource Name (ARN) to the secret ARN. Then, create the secret with a chosen user name and a randomly generated password set by the `GenerateSecretString` property. Add the database with the

MasterUserName and MasterUserPassword properties set to the user name of the secret.

D. Create the database with the MasterUserName and MasterUserPassword properties set to the default values. Then, create the secret with the user name and password set to the same default values. Add a Secret Target Attachment resource with the SecretId and TargetId properties set to the Amazon Resource Names (ARNs) of the secret and the database. Finally, update the secret's password value with a randomly generated string set by the GenerateSecretString property.
