#### **NEW QUESTION: 1**

Network Data Management Protocol (NDMP) technology should be used for backup if:

- A.** backup consistency over several related data volumes must be ensured.
- B.** file permissions that can not be handled by legacy backup systems must be backed up.
- C.** a network attached storage (NAS) appliance is required.
- D.** the use of TCP/IP must be avoided.

#### **Answer: C**

Explanation:

NDMP defines three kind of services: a data service that interfaces with the primary storage to be backed up or restored, a tape service that interfaces with the secondary storage (primarily a tape device), and a translator service

performing translations including multiplexing multiple data streams into one data stream and vice versa. NDMP services interact with each other. The result of this interaction is the establishment of an NDMP control session if the session is being used to achieve control for the backup or restore operation. It would result in an NDMP data session if the session is being used to transfer actual file system or volume data (including metadata). Control sessions are always TCP/IP-based, but data streams can be TCP/IP or SAN-based. NDMP is more or less NAS-centric and defines a way to back up and restore data from a device, such as a NAS appliance, on which it is difficult to install a backup software agent, in the absence of NDMP, this data must be backed up as a shared drive on the LAN, which is accessed via network file protocols, such as Common Internet File System (CIFS) or Network File System (NFS), degrading backup performance. NDMP works on a block level for transferring payload data (file content) but metadata and traditional file system information needs to be handled by legacy backup systems that initiate NDMP data movement. NDMP does not know about nor takes care of consistency issues regarding related volumes (e.g., a volume to store data

-- Exhibit --

Which command produces the output shown in the exhibit?

- A. show firewall log
- B. show log messages
- C. show services accounting usage
- D. show firewall counter telnet-counter filter select-telnet

**Answer: A**

**NEW QUESTION: 4**

HOTSPOT

You have a server that runs Windows Server 2012 R2 and has the iSCSI Target Server role service installed.

You run the New-IscsiVirtualDisk cmdlet as shown in the

New-IscsiVirtualDisk exhibit.  
(Click the Exhibit button.)

To answer, complete each statement according to the information presented in the exhibits.  
Each correct selection is worth one point.

**Answer :**

Explanation:

Explanation:

\* From the exhibit we see that the size is 10737418240 bytes.  
This is roughly 10 GB.

\* From the exhibit we also see 'Status: Not connected'.

Note: Target: It is an object which allows the iSCSI initiator to make a connection. The Target keeps track of the initiators which are allowed to be connected to it. The Target also keeps track of the iSCSI virtual disks which are associated with it. Once the initiator establishes the connection to the Target, all the iSCSI virtual disks associated with the Target will be accessible by the initiator.
