Answer: B

NEW QUESTION: 2

Ann was reviewing her company's event logs and observed several instances of GUEST accessing the company print server, file server, and archive database. As she continued to investigate, Ann noticed that it seemed to happen at random intervals throughout the day, but mostly after the weekly automated patching and often logging in at the same time. Which of the following would BEST mitigate this issue?

- A. Disabling unnecessary services
- B. Enabling time of day restrictions
- C. Disabling unnecessary accounts
- D. Rogue machine detection

Answer: C

Explanation:

User account control is a very important part of operating system hardening. It is important that only active accounts be operational and that they be properly managed. This means disabling unnecessary accounts.

Enabled accounts that are not needed on a system provide a door through which attackers can gain access. You should disable all accounts that are not needed immediately-on servers and workstations alike. Here are some types of accounts that you should disable:

Employees Who Have Left the Company: Be sure to disable immediately accounts for any employee who has left the company. This should be done the minute employment is terminated.

Temporary Employees: It is not uncommon to create short-term accounts for brief periods of time for access by temporary employees. These also need to be disabled the moment they are no longer needed.

Default Guest Accounts: In many operating systems, a guest account is created during installation and intended for use by those needing only limited access and lacking their own account on the system. This account presents a door into the system that should not be there, and all who have worked with the operating system knows of its existence, thus making it a likely target for attackers.

Incorrect Answers:

A. Time of day restrictions specify when accounts can log on; for example, during office hours only. The question states that the logins happen at random intervals 'throughout' the day. Time of day restrictions will not prevent the logins during 'authorized' hours. Therefore, this answer is incorrect.

B. It is good practice to disable unnecessary services. However, this will not prevent the guest logins in this question.

Therefore, this answer is incorrect.

D. Rogue machine detection is the process of detecting machines that should not be on the network. This will not prevent the guest logins in this question. Therefore, this answer is incorrect.
